Sankt Augustin, Germany

The problem

Past: production of graphics/maps is a business of professional designers and cartographers

Now:

- Wide spreading of statistical graphics and GIS software
- Appearance of visualization and mapping services in the Internet

⇒ It is necessary to incorporate required expertise into graphics software

2

Gdansk Poland, 21.07.2002

History of Intelligent Visualization Design

- 1967 J.Bertin – Theory of Visual variables
- 1986 J.Mackinlay – Implementation: using visual primitives, composition rules, and primitive tasks

All consider paper-like, static graphics for communication purposes

We are focused of dynamic, interactive graphics for visual data exploration

- 1995 V.Jung – Application to map design, taking into account primitive tasks

Descartes -> CommonGIS (Problem Definition)

Support exploratory data analysis and decision making by interactive maps and other visualization-based techniques

1. Bertin's theory of visual variables
2. Semantics of data
3. Interactivity of graphics
4. User's analytical task

4

Gdansk Poland, 21.07.2002

A Choropleth Map (8)

Can we use a choropleth map for comparing values?

Now we can compare Faro to the whole Portugal!

14

Gdansk Poland, 21.07.2002

Fraunhofer Institut
Autonome Intelligente
Systeme

Interactive Choropleth Map (Conclusion)

Our starting point:

	read values	find values	compare values	detect trend
Bar charts	certainly good	good	good	bad
Pie charts	average	certainly bad	good	bad
Choropleth maps / Intensity	bad	slightly good	certainly bad	good
Choropleth maps / hatching	average	slightly good	terrible	average

We successfully used an interactive choropleth map for

- reading values
- finding values
- comparing values (pairwise and one-to-many)

In addition:

- we could make spatial trends and patterns better visible
- we could investigate patterns more in detail

15

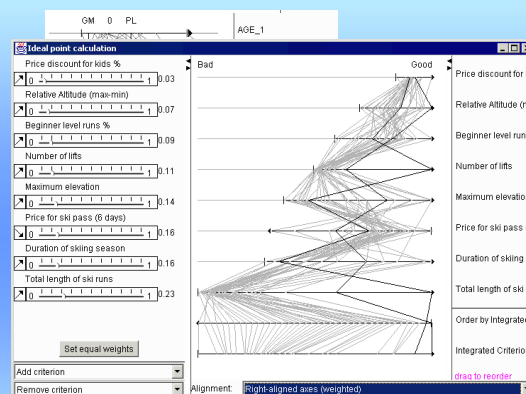

Gdansk Poland, 21.07.2002

Parallel Coordinates Plot: adaptation for problem solving

Possible usage (see Smart Graphics 2001):

- Comparison of absolute values
- Study of statistical distribution of values
- Find objects with similar values, compare objects
- Classify objects by similarity
- Evaluate objects by multiple criteria

16

Gdansk Poland, 21.07.2002

Pie charts ?

Demo:

Example of data exploration with
interactive pie-charts

17

Gdansk Poland, 21.07.2002

An Example of Tool Design: Data Analysis

- Given: time-series demographic data referring to areas of territory division (e.g. municipalities of Italy)
- Spatial objects (countries) can be regarded as stable in time, i.e. do not change their size, shape, or location, and do not disappear
- Changing are attribute values associated with the objects

18

Gdansk Poland, 21.07.2002

An Example of Tool Design: Task Analysis

What questions about the data (analytical tasks) can potentially arise?

“Local” tasks:

- What is the value of the attribute at moment t in area a ?
- How does the value in a_1 differ from that in a_2 at moment t ?
- How did the value in area a change from t_1 to t_2 ?
- How does the change in a_1 from t_1 to t_2 differ from that in a_2 ?
- What is the trend of value change in a over interval $[t_1, t_2]$?
- How does the trend in a_1 over interval $[t_1, t_2]$ differ from that in a_2 ?

“Global” tasks:

- What was the spatial pattern at moment t ?
- How did the pattern change from t_1 to t_2 ?
- How are the changes from t_1 to t_2 distributed over the territory?
- What is the trend of pattern change over interval $[t_1, t_2]$?
- How do the “local” trends vary over the territory?

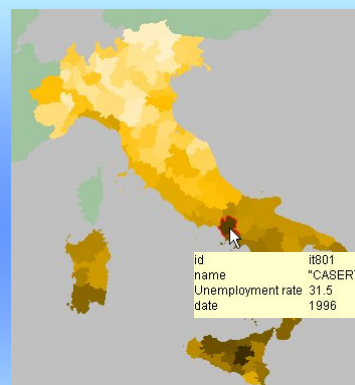

19

Gdansk Poland, 21.07.2002

An Example of Tool Design: Technique Selection

- See the spatial pattern at a moment: choropleth map
- See changes in the spatial pattern: choropleth map animation
- See values in areas: interaction with the map (mouse pointing)

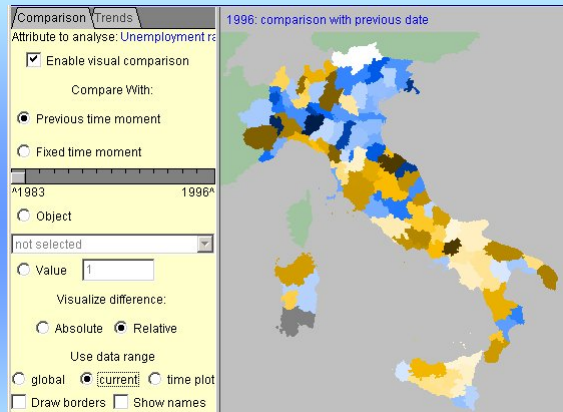

20

Gdansk Poland, 21.07.2002

An Example of Tool Design: Technique Selection (contd.)

- See changes at particular locations + spatial distribution of changes: change map

21

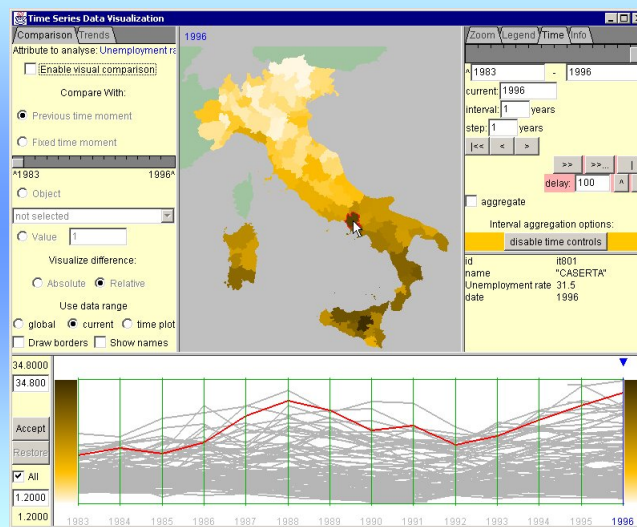

Gdansk Poland, 21.07.2002

Fraunhofer
AIS
Institut
Autonome Intelligente
Systeme

An Example of Tool Design: Technique Selection (contd.)

- See local trends, compare trends: time-series plot

... and so on

Task Analysis Problem

What questions about the data (analytical tasks) can potentially arise?

“Local” tasks:

- What is the value of the attribute at moment t in area a ?
- How did the value in area a change from t_1 to t_2 ?
- How does the trend in a_1 over interval $[t_1, t_2]$ differ from that in a_2 ?
- What is the trend of value change in a over interval $[t_1, t_2]$?
- How does the trend in a_1 over interval $[t_1, t_2]$ differ from that in a_2 ?

“Global” tasks:

- What was the spatial pattern at moment t ?
- How are the changes from t_1 to t_2 over the territory?
- What is the trend of pattern change over interval $[t_1, t_2]$?
- How do the “local” trends vary over the territory?

Have all potential tasks been enumerated?

We need a task typology!!!

23

Gdansk Poland, 21.07.2002

Known Typologies

“There are as many types of questions as components in the information”

J.Bertin

But...

- Where are such tasks as “compare” and “relate”?
- Is there a principal difference between the intermediate and overall levels?
- Is the concept of reading levels applicable to every data component (e.g. attributes)?

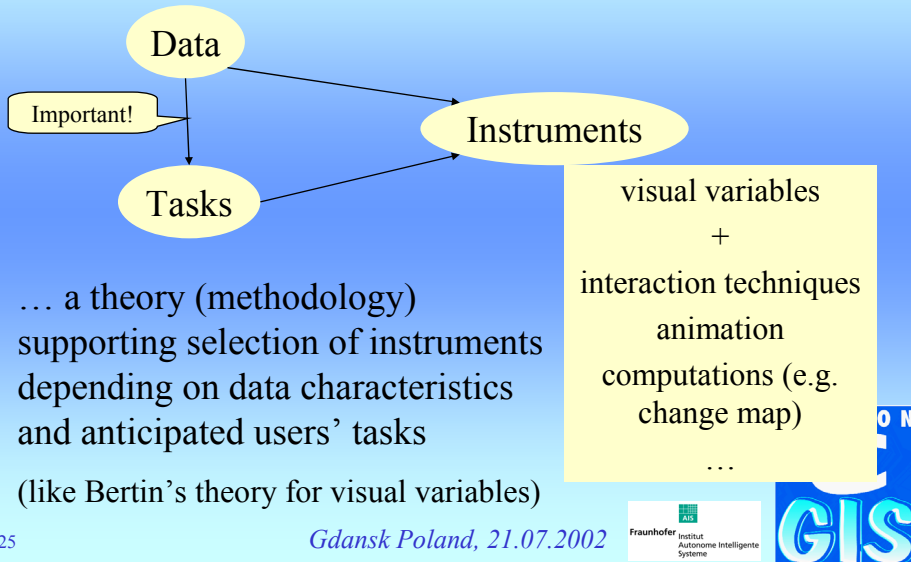

Good: task types expressed in terms of data components (not too abstract)

24

Gdansk Poland, 21.07.2002

What a Tool Designer Eventually Needs

Usability tests of CommonGIS

Goal:

Make our tools accessible and usable by a wide community of users

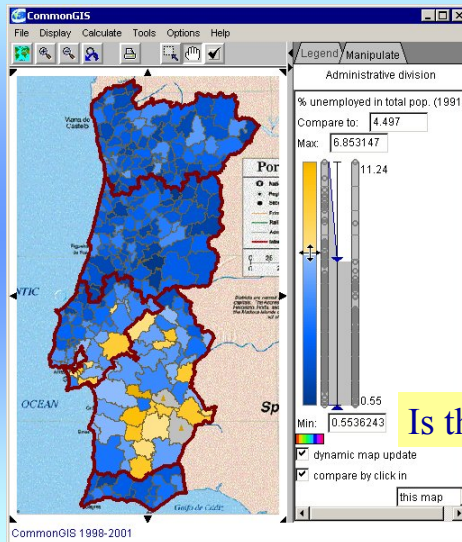

- ✓ accessibility: the tools are available in the Web and can run inside a standard Java-enabled browser
- usability: ???

26

Gdansk Poland, 21.07.2002

The Usability Problem

Opinion of the participants in the first usability studies in the CommonGIS project:

- the interactive tools are only for very advanced users
- ⇒ they should be hidden to avoid confusing „normal“ people

Is this a problem of UI?

27

Gdansk Poland, 21.07.2002

Fraunhofer
Institut
Autonome Intelligente
Systeme

What Is an Intuitive UI?

Which of the things is more „intuitive“?
It makes sense to talk about an intuitive UI when the user is expected to know the function of the thing or at least to guess it (by analogy with similar things)
⇒ When the function is new, the user has to be taught

28

Gdansk Poland, 21.07.2002

Fraunhofer
Institut
Autonome Intelligente
Systeme

The Second CommonGIS Usability Study

- Prior to the tests the subjects were given a live demo (~ 30 min.)
- The subjects were asked to fulfil various tasks and answer questions, in contrast to the „free“ exploration of the system in the first experiment
 - ⇒ The participants had to use the tools rather than just to view or play
 - ⇒ They concentrated on the utilitarian aspect of the tools rather than on their unusualness

29

Gdansk Poland, 21.07.2002

Fraunhofer
Institut
Autonome Intelligente
Systeme

An Example of a Test Task

The screenshot displays the CommonGIS software interface. The main window shows a map of Portugal with administrative divisions. A legend on the right indicates the current filter: "Administrative division" with the expression "%_Of_Pop_by_age_>=65". The "Compare to:" field is set to 20, and the "Max:" value is 35.2. A task dialog box titled "Task 2.5" is open, asking the user to identify districts with exactly 20% elderly population. The dialog includes a list of districts with checkboxes: Seta, Soure, Sardoal, Sao Pedro do Sul, Sao Joao da Madeira, and Vila do Bispo. The dialog also contains instructions about the "Visual comparison" tool and buttons for "OK", "Dont know", and "Quit".

Results of the Studies

Interactive tool	Total number of questions		Relative number of errors (% to the total number of answers)	
	1 st round	2 nd round*	1 st round	2 nd round*
Outlier removal (focuser)	12	6	9.25%	2.78%
Visual comparison (choropleth map)	15	10	8.89%	1.67%
Dynamic classification	16	8	12.50%	8.33%
Dynamic query	13	9	28.20%	12.96%
Dynamic link map ↔ scatter plot	15	11	8.89%	0%
Total	71	44	13.30%	4.92%

* The 2nd round took place 1 month after the 1st round. The same people participated in the 1st and the 2nd rounds. The purpose was to test if the users are able to preserve their skills in operating the tools.

31

Gdansk Poland, 21.07.2002

Results of the Studies (Conclusion)

- ✓ Objective result: the subject were rather successful in fulfilling the tasks by using the interactive tools.
 - ✓ Subjective result: the subjects liked the system and found it „fun to use“. Some participants were willing to use the system in their work.
- ⇒ The studies confirmed the importance of teaching.

32

Gdansk Poland, 21.07.2002

How to Teach the Users?

Options:

- Lecture/demonstration
 - Works well, but not always possible
- Printed manual
- On-line help
- Wizards
- On-line tutorials

33

Gdansk Poland, 21.07.2002

How to Teach the Users?

Options:

- Printed manual
- On-line help
- Wizards
- Tutorials

Problems:

People generally tend to avoid reading instructions

} Before looking for explanation in the help or launching a wizard, one must already know what function he/she needs

People have to invest their time and efforts before actual use of the tools for their own purposes. ⇒ They would do this only being strictly sure that it is worthwhile.

⇒ It would be good to teach the users by assisting them when they do their own analyses and decision making

34

Gdansk Poland, 21.07.2002

Intelligent User Guidance

Functions of the guide:

- Suggest appropriate tools according to the current user's task
- Instruct about the use of the tools in the context of this task
- Help the user in launching the tools

⇒ The guide needs to know the user's task

35

Gdansk Poland, 21.07.2002

What Is Needed for User Guidance?

... a theory (methodology)
supporting selection of instruments
depending on data characteristics
and user's tasks

36

Gdansk Poland, 21.07.2002

How to Determine the User's Task?

- Guess

- Ask the user

... is only possible after the user has made some relevant operation(s)

... but not too often!

- In data analysis or decision making the user performs lots of tasks.
- + These tasks are interrelated rather than independent. They usually emerge in a logical sequence.
- ✓ This feature can be utilised.

37

Gdansk Poland, 21.07.2002

General Scenarios

<p>Scenario: Analyse demographic data</p> <ul style="list-style-type: none"> ○ Overview the territory ☑ Explore spatial characteristics of demographic phenomena <ul style="list-style-type: none"> ○ Consider spatial variation of individual attributes ☑ Consider jointly several attributes <ul style="list-style-type: none"> ○ Compare data for different time moments ○ Consider data for different groups of population ○ Compare spatial distributions of values of attributes 	<p>Scenario: Select suitable spatial entities</p> <ul style="list-style-type: none"> ☑ Explore the opportunities <ul style="list-style-type: none"> ○ Survey the territory ○ Survey spatial distribution of options ○ Study variation of attribute characteristics of the options ○ Reveal relationships between attributes of the options ○ Select suitable options
--	---

See a demo of the CommonGIS task supporting guide

- The user indicates which scenario corresponds better to his/her goals.
- The scenario contains a list (hierarchy) of potentially relevant tasks.
- The user selects tasks from the list, and the guide assists in fulfilling them.
- The task list 1) allows the user to indicate the current task; 2) serves as a reminder for the user.

Conclusion

- Interactivity changes properties of maps
- Tasks are important
 - for tool design
 - for user instruction and guidance
- Task typology is badly needed
- People should be taught to use new visualisation techniques
- The prototype guide needs to be extended, improved, and tested

39

Gdansk Poland, 21.07.2002

Software

- Implementation: Java 1.1 compatible
 - Standalone application
 - Web applet
- The system is free for educational and research purposes
- Downloads at <http://www.CommonGIS.de>
